XXXVII Congress of European Society of Lymphology

Warsaw (Poland) - 3-4 June, 2011

Medical Research Center, Polish Academy of Sciences
5 Pawinski Street, 02-106 Warsaw, Poland

Clinical Sciences

Physiology and Diseases of the Lymphatic System

- Scientific program

Scientific Sessions (Abstracts):
- Session 1 Anatomy & Physiology
- Session 2A Pathology I
- Session 2B Pathology II
- Session 3 Diagnosis of Lymphedema
- Session 4 Conservative Therapy
- Session 5A Surgical Therapy I
- Session 5B Surgical Therapy II
- Session 6 Lymphology outside Europe

Calendar

23rd International Congress of Lymphology - 19-23rd September 2011, Malmö (Sweden)
THE EUROPEAN JOURNAL OF LYMPHATOLOGY AND RELATED PROBLEMS (EJLRP)

The EJLRP - official organ of the European Group of Lymphology (ESL), Czech Society of Lymphology, Romanian Society of Lymphology, Greek Society of Lymphology, the Latin-Mediterranean Chapter of Lymphology (LMLC), the Società Italiana di Linfologia (SIL) covers all fields of Lymphology and aims to present a multidisciplinary approach to diseases of the lymphatic system, with information on the analysis, control and treatments of such diseases.

Topics
The topics include:
- anatomy and anatomopathology
- physiology and physiopathology
- pharmacology
- diagnostic methods (conventional radiology, nuclear medicine, ultrasonography, computed tomography, biopsy, nuclear magnetic resonance)
- therapy (surgery, medicine, radiotherapy, physical)
- oncology (primary lymphatic system diseases, lymphoedema metastatic process)
- immunology
- post-therapeutic complications
- upper and lower limb edemas

Subscription rates - All members of European Group of Lymphology or National Societies (with which the ESL has a cooperation agreement and whose fee includes a subscription to the EJLRP) receive the Journal free of charge.

Subscription rate for non-members is:
- for all issues, 30 € within European Countries, 50 € elsewhere,
- for single issue, 15 € within European Countries, 18 € elsewhere.

Annual subscription rate of ESL: 80 €

Please make cheques in euro to the Treasurer of the ESL.

Data base & Treasurer of the ESL - J.P. BELGRADO: Université Libre de Bruxelles, CP 168, Av. F.D. Roosevelt, 50, 1050 Bruxelles, Belgium.
Tel. +32 2 650.24.34 - Fax: +32 2 280.13.33 - Mobile +32 475 63.34.34

Business communications - Business communications concerning advertising, subscriptions, change of address, and permission requests should be sent to the Secretary, G. LEDUC, Service de Kératithérapie, Avenue Paul Héger, 28 CP 168, 1050 Brussels, Belgium. Tel. (32) (2) 650.24.70 - Fax: (32) (2) 650.24.75.

Advertisements are subject to editorial approval and restricted to products or services pertinent to lymphology. Advertising rates can be obtained from the Secretary and Treasurer.

Miscellaneous - The use of general descriptive names, trade names, trademarks, etc., in the publication, even if not specifically identified, does not imply that these names are not protected by the relevant laws and regulations.

While the advice and information in this Journal is believed to be true and accurate at the date of its going to press, neither the authors, the Editors, nor the publisher can accept any legal responsibility for any errors or omissions that may be made. The publisher makes no warranty, express or implied, with respect to the material contained herein.

The Editors do not accept any responsibility for opinions that may be made by the authors.

Areas of distribution - Austria, Belgium, Czech Republic, Denmark, Egypt, France, Germany, Greece, Holland, Hungary, Israel, Italy, Japan, Norway, Poland, Portugal, Rumania, Russia, Spain, Sweden, UK, USA.
4. COMBINED DECONGESTIVE THERAPY IN GREECE: AN EFFECTIVE TREATMENT OF LYMPHEDEMA

E. DIMAKAKOS, J. KALEMIKAKIS, Z. YARDIK, G. POUKA, G. ANTONATOS, K. KROUSIANOTAKI, E. LYMPEROPOULOU

Lymphology Unit of Angion Medicine, Center of Vascular Diseases, Athens, Greece
TII of Athens, Greece
Oncology Unit of 3rd Internal Clinic of the University of Athens School of Sotiria, General Hospital, Athens, Greece

Aim of this work was to study the reduction of volume of the extremity after Combined Decongestive Treatment (CDT) twice a day for four weeks. CDT includes skin care, mild, bandage, exercises and education of the patient. Method. We treated 71 patients with either primary or secondary lymphedema (PL-SL) for four weeks. Results. From 71 patients with lymphedema 20 patients had primary lymphedema (p) and 51 secondary lymphedema (sl). 48 were females (13 pl – 35 sl) and 23 males (7pl – 16 sl). At the first measurement we found a mean Edema = 3025 ml, which was 46% over than the normal level of lymph. At the last measurement we found a mean Edema = 1099 ml, which was 14% over than the normal level of lymph. In all patients we had a mean reduction of volume of 65,09% in upper extremity lymphedemas and mean reduction of volume of 69,96% of the lower extremity. In patients with lymphedema <12 months the reduction was about 72,5% whereas in patients with lymphedema >12 months the reduction was about 55,5%. Conclusion. The treatment of lymphedema with CDT was successfully in all patients with almost the same results in both extremities. Prevention of the onset of lymphedema is of extreme importance. However, a return to normal a lifestyle as possible by the patient is also essential. The earlier treatment begins after the onset of lymphedema, the better the prognosis for the patient. Moreover the target of the treatment must be a reduction of the volume between 50%-70% of the initial edema.

5. COMPRESSION THERAPY OF SWOLLEN LOWER LIMBS: TISSUE FLUID HYDRAULICS, CLINICAL EFFECTS

MARZANNA ZALESKA, WALDEMAR L. OLSZEWSKI, MARTA CACAŁA, PRADEEJ JAIN

Introduction. Removal of edema tissue fluid (TF) from swollen tissues is indispensable for prevention of limb volume increase, development of fibrosis and dermo-lymphangiodegeneration. Aim. To apply mechanical compression enabling TF flow to overcome tissue resistance and create flow to non-swollen regions. Methods. Hydraulics of tissue fluid in swollen lower limb (lymphedema, venous insufficiency with ulcers, posttraumatic hematoma) were studied using sequential pump at various pressures with no deflation of distal segments and measuring subcutaneous tissue fluid pressure with wick-in-needle method, tissue fluid movement with plethysmography and tissue compliance with tonometry. Results. Minimum TF pressures enabling fluid flow ranged between 25 and 30 mmHg. Depending on the stage of lymphedema, to reach this pressure level, sleeve pressures had to be raised from 80 to above 120 mmHg. Much the same was necessary in edema in the postthrombotic syndrome with fibrotic skin. Tonometry measuring skin and subcutis rigidity was found indispensable for choosing proper inflation pressures. Tonometry force of 6600g/cm² generated pressures of 40-70mmHg in stage II, however in stage IV tonometry force of 1500-6000g/cm² produced pressure of only 40mmHg. This was an indication for sleeve pressures >120mmHg. Continuous recording of circumference changes at 6 levels allowed to calculate centripetal tissue fluid movement. It ranged 13-120 ml at each sleeve inflation. Conclusions. In 10 advanced lymphedema cases stage III/IV treated with inflation pressure of 120mmHg, no distal chambers deflation, for 12 months 1 hour a day, a decrease in calf girth by 5-7 cm was obtained and no debulking surgery was needed.

6. FORMATION OF TISSUE FLUID CHANNELS IN LYMPHEDEMATOUS SUBCUTANEOUS TISSUE DURING INTERMITTENT PNEUMATIC COMPRESSION THERAPY

OLSZEWK W.L., ZALESKA M.I., CACAŁA M.I., JAIN P.

Introduction. In advanced lymphedema of lower limbs of postinflammatory, posttraumatic or postsurgical etiology the collecting lymphatics are obstructed. Lymph flow is practically nil. Tissue fluid accumulates in soft tissues spaces. Pressures generated by muscular contractions, and massage move fluid through spontaneously formed tissue channels. These irregular shape channels are seen along small vein tributaries, in the loose connective tissue and along collagen bundles. We tried to enhance formation of these channels by high pressure long-term pneumatic massage. Aim. To observe formation of tissue channels during high pressure pneumatic therapy using lymphoscintigraphic and biopsy histochemical methods. Material. Ten patients with lymphedema stage II/III of lower limbs were investigated. An 8-chamber sequential pneumatic device was used for compression therapy. The parameters of compression were: inflation pressure 120-100mmHg, sequential pneumatic device was used for compression therapy. The parameters of compression were: inflation pressure 120-100mmHg, skin and subcutaneous tissue biopsies were taken before and after treatment. Specimens were injected with Paris Blue in chloroform and made translucent to visualize spaces filled with mobile tissue fluid and subepidermal lymphatics. Results. Lymphoscintigraphic imaging. After one year of massaging multiple wide channels filled with tracer and subepidermal lymphatics. Conclusions. Long term high pressure pneumatic compression brings about formation of multiple fluid channels running to the groin and femoral channel but not to the lateral parts of the limb. These channels are not lined with endothelial cells.
